

#### **Neutrino Facts and Trivia**

- What is a neutrino?
  - an elementary particle
    - » has no mass (in SM)
      travels at speed of light (for now)
    - » has no electric charge
    - » interacts little with any other matter (pure week interaction)
      - ==> can pass through 50 billion miles of water without interacting
      - ==> this in turn allows us see the interior of stars and provides us with information otherwise not obtainable by the traditional optical telescopes

==> neutrino telescopes

#### **Neutrinos from Stars**

#### Solar Neutrinos

- produced by nucleosynthesis inside the Sun
- Flux on the surface of the Earth: ~ 500 billion neutrinos/cm<sup>2</sup>/sec
  - » Solar Neutrino Puzzle

One of the most fascinating and longest running unsolved mysteries in physics

#### Supernova Neutrinos

- produced by the neutralization process at the core
- carry 99% of the supernova energy
- observed for the first time in 1987 (SN1987a): a total of 20 events by two detectors (IMB and Kamiokande) in about 10 second period of time ==> a triumph of supernova theory

#### **Neutrinos from the Earth**

- Atmospheric Neutrinos
  - produced by the cosmic rays bombarding on the atmosphere
  - first evidence for neutrino oscillationdiscovery of non-zero neutrino mass
- Terrestrial Neutrinos
  - produced by natural radioactivity
  - − ~ 6 million neutrinos/cm²/sec
- Man-made Neutrinos
  - produced by particle accelerators, nuclear reactors
- Homo sapiens Neutrinos
  - produced by Potassium 40 decay in our body (~20 mg)
  - ~340 million neutrinos/day

#### Neutrinos from The Big-Bang

- Relic (thermal background) Neutrinos
  - produced 1 second after Big-Bang
  - a la 2.7° cosmic microwave background
  - ~ 300 neutrinos/cm<sup>3</sup> in our universe
    - » if neutrino has mass, it can influence the ultimate fate of the Universe. (open? or closed Universe?)

```
m_v \sim 30 \text{ eV}, closed universe (\Omega >= 1)
```

 $m_v \sim a$  few eV, "Dark Matter" candidate ( $\Omega \sim 0.2$ )

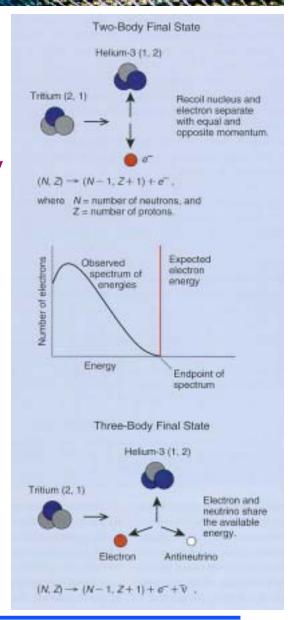

m<sub>v</sub> ~ 1/20 eV, total neutrino mass in the Universe

- ~ total luminous matter mass ( $\Omega \sim 0.003$ )
- never been directly detected (poses biggest challange to experimentalists, in fact observation has never been attampted.)

#### **Historical Perspective**

- 1930: W. Pauli
  - first postulated existence of "Neutron" to explain continuum beta decay spectrum
    - » proton, electron and photon were the only known elementary particles
  - later "Neutron" renamed to "Neutrino" by Fermi
- 1956: Reines-Cowan (Savannah River Reactor Experiment)
  - positive observation of neutrino interactions utilizing inverse beta decay

$$\overline{v}_e + p \longrightarrow n + e^+$$

#### Pauli's Letter

#### The Desperate Remedy

4 December 1930 Gloriastr. Zürich

Physical Institute of the Federal Institute of Technology (ETH) Zürich

Dear radioactive ladies and gentlemen,

As the bearer of these lines, to whom I ask you to listen graciously, will explain more exactly, considering the 'false' statistics of N-14 and Li-6 nuclei, as well as the continuous  $\beta$ -spectrum, I have hit upon a desperate remedy to save the "exchange theorem" of statistics and the energy theorem. Namely [there is] the possibility that there could exist in the nuclei electrically neutral particles that I wish to call neutrons, \*\* which have spin 1/2 and obey the exclusion principle, and additionally differ from light quanta in that they do not travel with the velocity of light: The mass of the neutron must be of the same order of magnitude as the electron mass and, in any case, not larger than 0.01 proton mass. The continuous  $\beta$ -spectrum would then become understandable by the assumption that in  $\beta$  decay a neutron is emitted together with the electron, in such a way that the sum of the energies of neutron and electron is constant.

#### continue: Pauli's Letter

But I don't feel secure enough to publish anything about this idea, so I first turn confidently to you, dear radioactives, with a question as to the situation concerning experimental proof of such a neutron, if it has something like about 10 times the penetrating capacity of a  $\gamma$  ray.

I admit that my remedy may appear to have a small a priori probability because neutrons, if they exist, would probably have long ago been seen. However, only those who wager can win, and the seriousness of the situation of the continuous  $\beta$ -spectrum can be made clear by the saying of my honored predecessor in office, Mr. Debye, who told me a short while ago in Brussels, "One does best not to think about that at all, like the new taxes." Thus one should earnestly discuss every way of salvation.—So, dear radioactives, put it to test and set it right.—Unfortunately, I cannot personally appear in Tübingen, since I am indispensable here on account of a ball taking place in Zürich in the night from 6 to 7 of December.—With many greetings to you, also to Mr. Back, your devoted servant,

W. Pauli

## **Pauli's Picture**

#### W. Pauli and Maurice Goldhaber

#### Continue: Historical Perspective

- 1957: B. Pontecorvo
  - first suggestion of neutrino oscillation
    - $v \longrightarrow \overline{v}$  (massive Majorana particle)
- 1963: Lederman, Schwartz, Steinberger experiment at BNL
  - positively distinguished  $\nu_{\mu}$  from  $\nu_{e}$ 
    - » concept of generation
    - » neutrino oscillation between generations

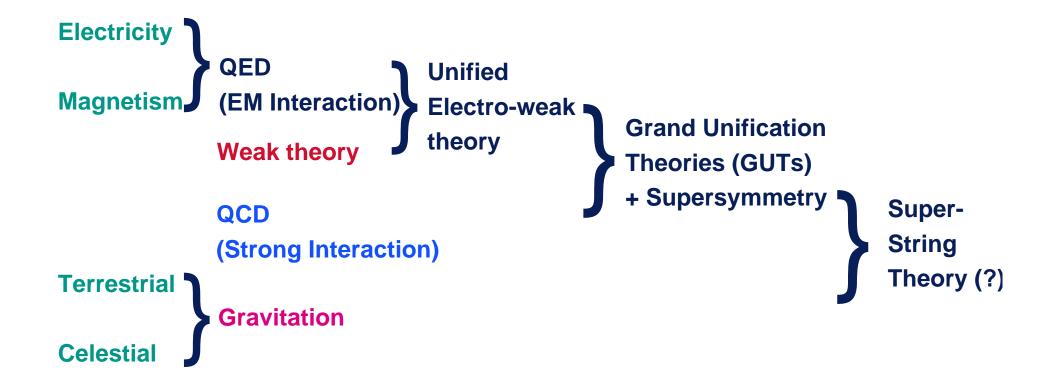

$$V_{\mu} \longrightarrow V_{e}$$

- 1969 R. Davis experiment at the Homestake mine
  - observed less solar nu ( $v_e$ ) flux than predicted
    - » Beginning of the Solar Neutrino Problem

#### **Continue: Historical Perspective**

- Late 1980's: IMB and Kamiokande experiments
  - observed less atmospheric nu flux ratio ( $v_u/v_e$ ) than predicted
    - » Beginning of the ATM Neutrino Problem
- 1987: First observation of neutrinos from supernova explosion
  - SN1987a
- 1995: LSND experiment at LANL
  - reported positive observation of  $\overline{\mathbf{v}}_{\mu} \longrightarrow \overline{\mathbf{v}}_{e}$
- >>> Neutrino Oscillations???
- 1998: Super-Kamiokaned experiment at Kamioka, Japan
  - evidence for oscillations of atmospheric neutrinos
- 2000: DONUT experiment at Fermilab
  - direct observation of  $v_{\tau}$

## Unification of Particle Interaction Theories

Standard Model (SM)
= Unified Electro-weak theory + QCD
(not a truly unified theory)

## Potential Future Great Discoveries

- Extra Dimensions Superstring
- Supersymmetric Particles SUSY
- Proton Decay GUT/SUSY/Superstring
- Identity of Dark Matter SUSY(?)
- Nature of Dark Energy
- Magnetic Monopoles

\_

#### Quest for Grand Unification

- Search for Proton Decay
  - In SM, protons do not decay
    - ==> Baryon number conservation law
      - -->Accidental or approximate
  - GUT models (SU(5), SO(10), E<sub>6</sub>...)
    - ==> Quark-Lepton unification
    - ==> Color-charge quantization
    - ==> Coupling constant Unification (SUSY GUTs)
    - ==> predict decay of protons (generic prediction)

Proton decay - only direct experimental access to 10<sup>16</sup> GeV (10<sup>-30</sup> cm) scale

==> Truly an energy frontier experiment

==> To date, there are no experimental evidence for proton decay

## Why a Next generation Nucleon decay and Neutrino (NNN) Experiment?

- Non-zero Neutrino Masses
  - In SM, neutrino masses are assumed to be zero
  - In many of the GUT Models, small neutrino masses are predicted through Seesaw Mechanism

$$m(v_i) = \frac{m_{Di}^2}{M} \qquad (M >> m_{Di})$$

 $m_{Di}$ : Dirac mass of charged fermion

M: Majorana mass of  $v_R$  depends on the mass scale of the models

Thus, observation of small non-zero neutrino mass could lead us to the physics of very high mass scale, which in turn could lead us to proton decays

Super-Kamiokande observation of the non-zero neutrino mass

- ==> could be the first evidence for Grand Unification
- ==> Motivation for renewed effort for proton decay searches

#### Neutrino Oscillation in Vacuum

Survival Probability

$$P(v_e \rightarrow v_e) = 1 - \sin^2(2\theta)\sin^2\left(\frac{\Delta m^2 L}{4E}\right)$$

Oscillation **Probability** 

$$P(v_e \to v_\mu) = \sin^2(2\theta)\sin^2\left(\frac{\Delta m^2 L}{4E}\right)$$

 $\Rightarrow \Delta m^2 (\equiv m_1^2 - m_2^2)$  and  $\sin^2(2\theta)$  are oscillation parameters given by the nature

 $\Rightarrow$  L(source to observer distance) and E(neutrino energy) are exerimental parameters

$$\left(\frac{\Delta m^2 L}{4E}\right) \Rightarrow \left(1.27 \frac{\Delta m^2 L}{E}\right) \text{ with } \begin{bmatrix} \Delta m^2 \text{ in } eV^2 \\ L \text{ in } km \\ E \text{ in } GeV \end{bmatrix}$$

 $P_{v \to v'} = \sin^2 2\theta \sin^2 (1.27 \Delta m^2 L/E)$ 

#### John Updike's Poem

Neutrinos, they are very small.

They have no charge and have no mass

And do not interact at all.

The earth is just a silly ball

To them, through which they simply pass,

Like dustmaids down a drafty hall

Or photons through a sheet of glass.

They snub the most exquisite gas,

Ignore the most substantial wall,

Cold-shoulder steel and sounding brass,

Insult the stallion in his stall.

And, scorning barriers of class,

Infiltrate you and me! Like tall

And painless guillotines, they fall

Down through our heads into the grass.

At night, they enter at Nepal

And pierce the lover and his lass

From underneath the bed-you call

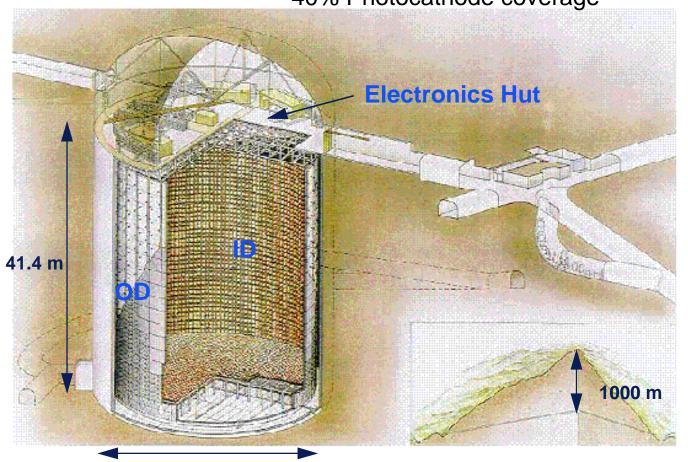

It wonderful; I call it crass\*

\*©John Updike. 1960. From Telephones Poles and other Poems. Alfred A. Knopf, Inc., New York, 1963.

#### Super-Kamiokande Experiment

#### 50 kton Water Cherenkov Detector

- -- Inner Detector (ID) w/ 11,000 20" PMTs
- -- Outer Detector (OD) w/ 1,840 8" PMTs
- -- 40% Photocathode coverage

Research Goals
 Proton decay searches
 Solar neutrinos
 Atmospheric neutrinos
 Astophysical neutrinos
 ==> neutrino oscillations

The Collaboration~120 physicists23 institutions fromJapan and US

39.4 m

#### **SuperK Photos**

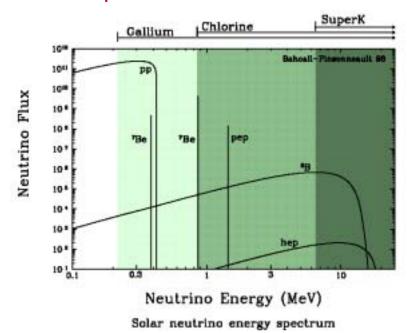

- Inner Detector Construction August 1995
- Completed Outer Detector October 1996
- Water Filling of the Detector January 1996

## Water Cherenkov Detector Technique

- Detection of Cherenkov light in water 2 viewgraphs
- Photo Multiplier Tube (PMT) 2 viewgraphs
- SuperK event display through going muon event
- SuperK event display contained muon neutrino event
- 8" PMT used in the IMB detector
  - detected neutrinos from SN1987a

#### Solar Neutrino Puzzle

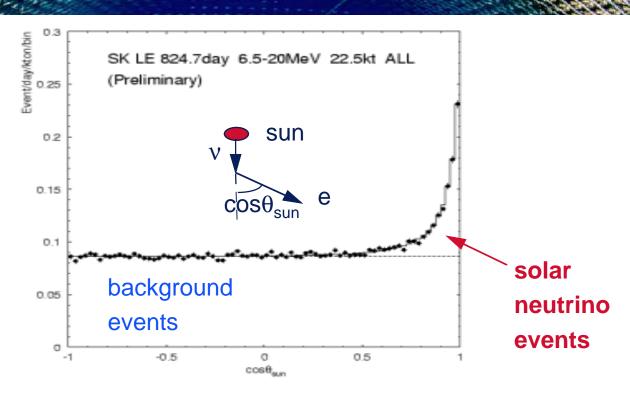

- Standard Solar Model (SSM)
  - Detailed theoretical calculation of nucleo-synthesis in the Sun pioneered by J. Bahcall in ~1960
  - Neutrinos along with photons produced during the processes of nuclear synthesis
    - » these neutrinos let us "see" inside the sun where the "light" telescopes cannot see

p-p Chain

(98% of energy generation)

## SuperK Solar Nu Flux Measurement

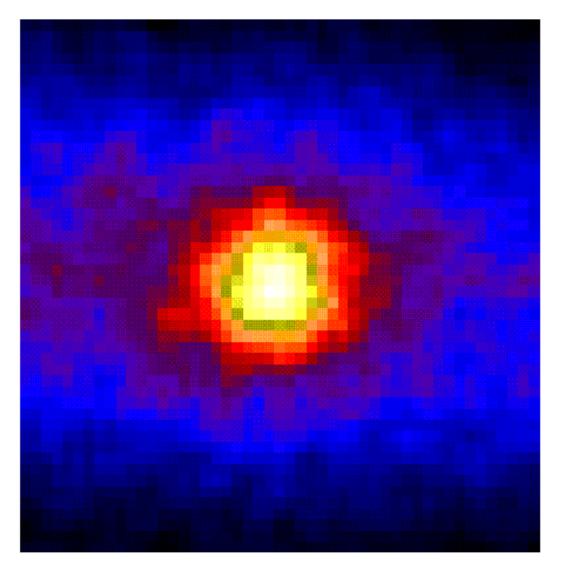

- Real time and Directional Measurement
  - Events point back to the sun (provides unambiguous proof that these neutrinos are coming from the sun

$$\frac{Data}{SSM(BP98)} = 0.475 + 0.008 + 0.013 - 0.007 - 0.013$$

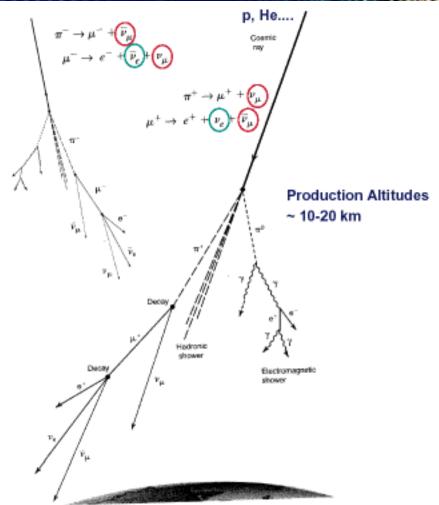

==> confirms solar neutrino flux deficit

## Super-Kamiokande Solar Image

Neutrino Image of the Sun observed with the Super-Kamiokande Neutrino Telescope

## **Atmospheric Neutrinos**

Naively,

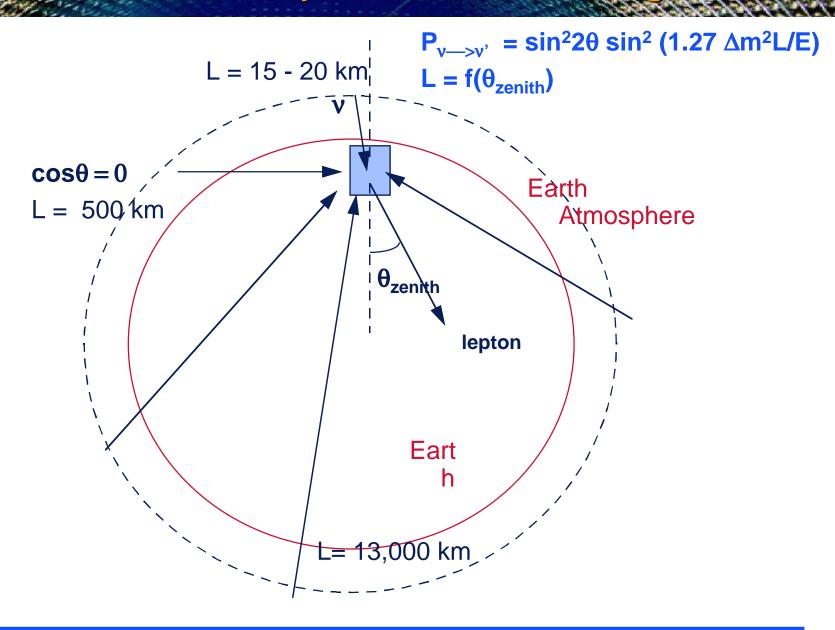

$$r = \frac{v_{\mu} + \overline{v}_{\mu}}{v_{e} + \overline{v}_{e}} \approx 2$$

 $R = \frac{(\mu/e)_{data}}{(\mu/e)_{MC}}$ 

(~20% uncertainty in the absolute neutrino flux calculation however, / has less than 5% uncertainty)

R=1 if no anomaly

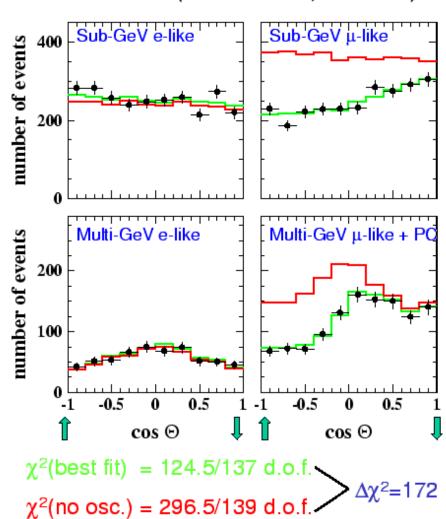

## Neutrino flux dependence on zenith angle

#### SuperK Observation of Neutrino Oscillations

#### 1144.4 days (70.4 kt-yrs)

No oscillation
Best fit (Δm²=3.2x10³eV², sin²2θ=1.00)

#### Atmospheric Neutrinos

- SuperK firmly establishes neutrino oscillaition in atmospheric neutrinos
  - $-1.6 < \Delta m^2 < 3.8 \times 10^{-3} \text{ eV}^2$ ,  $\sin^2 2\theta > 0.9 @90\% \text{ C.L.}$
  - no internal inconsistency
- Supporting evidence from other experiments
  - IMB, Kamiokande, Soudan 2, MACRO
  - No external inconsistency among experiments
- ==> Far-reaching impact on particle, nuclear and astrophysics
  - SuperK oscillation paper: the 2nd most cited (> 1000) exp. particle physics paper after the J/psi paper ("November Revolution") ==> 1 citation/day rate
  - small non-zero neutrino mass (~0.05 eV)

existence of high energy scale physics (See-saw mechanism)

Reconstructed Neutrino Energy (MC)

## Observed Energy Spectrum at Superk

#### **K2K Summary**

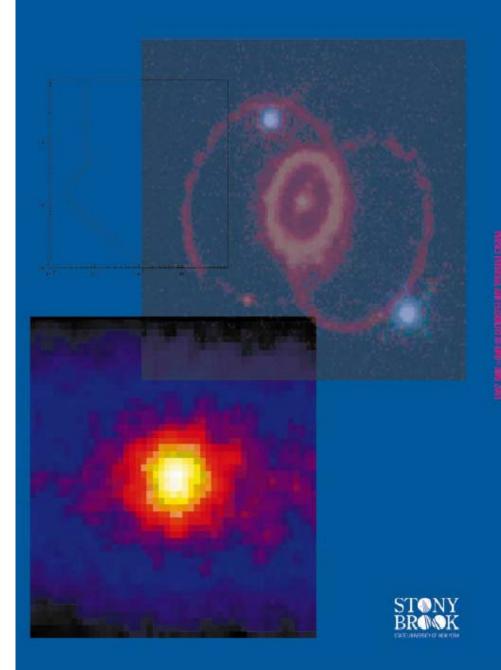

- K2K is running very well
  - Beam intensity at the design level
  - June 1999 April 2001 data:
     3.85 (4.58) x 10<sup>19</sup> POT SuperK live (delivered)
    - » additional data (May July 2001) being analyzed
    - » Goal: accumulate 10<sup>20</sup> POT (~untill 2004)
  - 44 observed events compared to 63.9<sub>-6.6</sub>
     (sys) expected from null oscillation
    - » null oscillation probability < 3%</p>
  - Energy spectrum analysis is underway
    - » qualitatively the observed energy spectrum consistent w/ the SuperK atm best fit parameters
    - » quantivative results to come in spring 2002

#### continue: K2K Summary

- First successful long-baseline neutrino oscillation experiment w/ a baseline O (100km)
  - leads to rich neutrino physics programs of future long- baseline experiments: MINOS, CNGS, JHF--> SuperK, superbeams and neutrino factories...

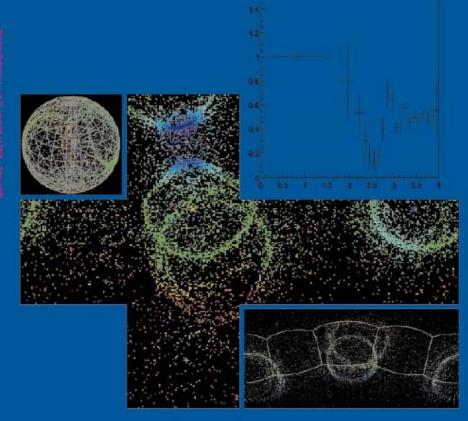

#### Implications of Non-zero Neutrino Mass

- The first and only experimental observation that deviates from the SM framework since 1970's
  - SM must be modified to Grand Unified theories or other extensions that predict non-zero neutrino masses
- Neutrinos travel slower than speed of light
- Violation of flavor lepton number conservation law
- Solar neutrino problem: likely due to neutrino oscillations
- Neutrino contribution to the mass of the Universe
- Dynamics of the Universe and structure formation need to be reexamined
  - How is mass distributed in space and how did it get there?
- Leptogenesis?
- Openning of whole new neutrino physics industry
- Possibility of Proton decay ==> UNO Experiment

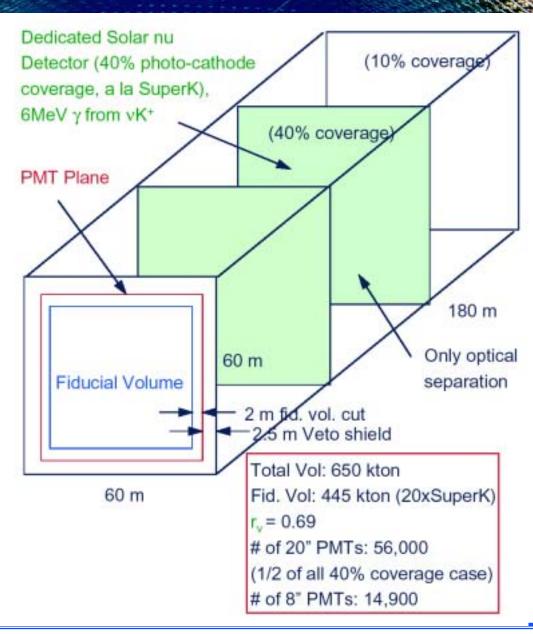

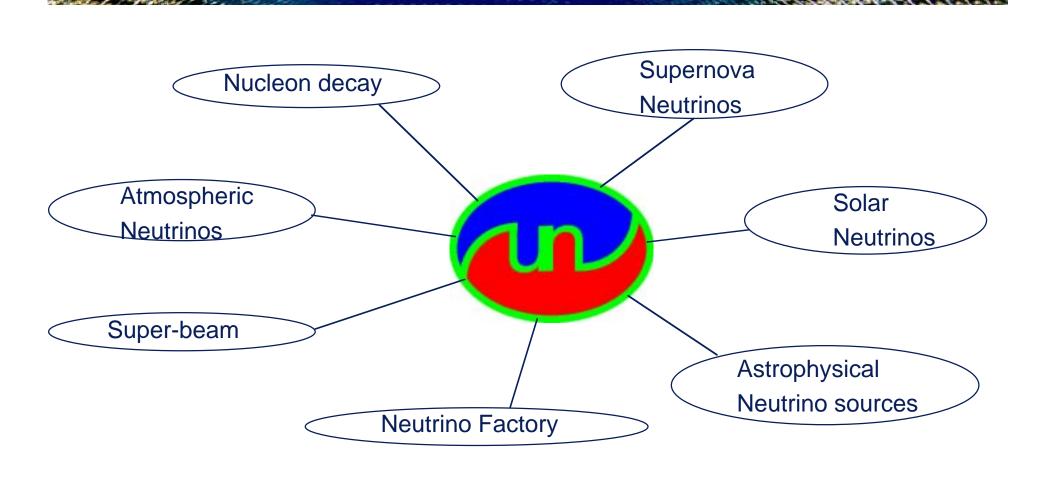

# PHYSICS POTENTIAL AND FEASIBILITY OF UNO

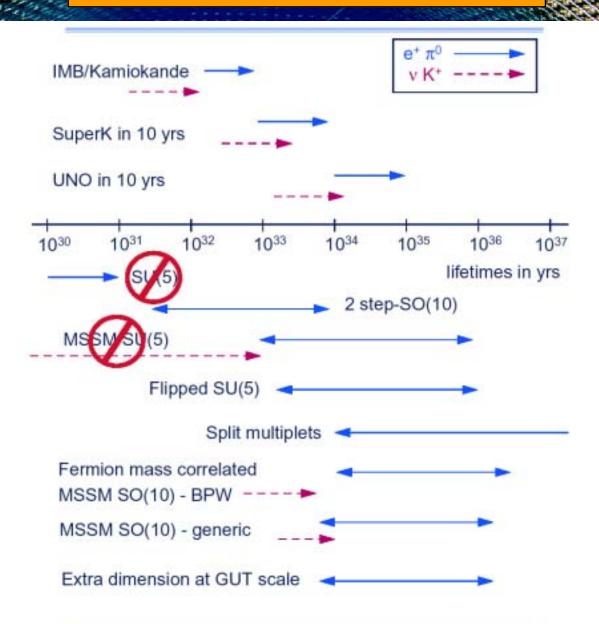

## UNO Baseline Configuration

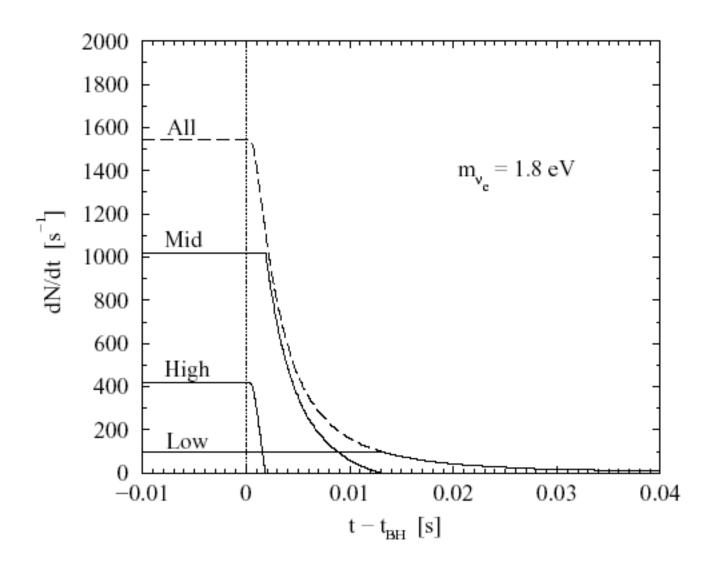

#### **UNO Proton Decay Sensitivity**

## UNO Supernova Neutrino Sensitivity

- ~140k nu events at 10 kpc
  - detailed mapping of the time structure of the neutrino flux at ms scale
- detection reach: ~1 Mpc which includes most of the "Local group of Galaxies" including Andromeda
  - » ~ 1 supernova detection/10 years
- together with SuperK, provides good triangulation for supernova early warning for optical observations
- recall that we recorded only 20 supernova neutrino events in human history from Supernova 1987A

## Galactic Supernova

#### Possible Observation of Birth of a Black Hole!

#### **UNO Summary**

- Large scale water Cherenkov detecters
  - Proven technology (2 decades of Physics experience: IMB, Kamiokande and Super-Kamiokande)
    - » Observation of neutrino oscillations (mass)
    - » Observation of neutrinos from SN1987A
    - » First real time and directional observation of solar neutrinos
    - » Confirmation of the solar neutrino flux deficit
    - » World best limits on nucleon decays
      - ==> exclusion of minimal SU(5)
      - ==> exclusion of MSSM SU(5)
  - Water cheapest medium, for p -->  $e^+\pi^0$  mode SuperK detection efficiency is ~40%
    - » hard to improve
- UNO design optimized for Physics/Cost (Multi-purpose)

#### continue: UNO Summary

- Challenges
  - No critical path R&D items (can start construction within 3 years)
  - identifying an underground site with good rock quality for an extraordinary cavern size (60m x 60m x 180m)
- Requirements for a NUSL
  - depth > 3,000 m.w.e.
  - a location w/ good quality rock
  - excavation capacity: > 3 kton (rock)/day
    - » (assuming 1M m<sup>3</sup> excavation in 1000 days)
    - based on a preliminary construction schedule sent to HEPAP sub-panel: 10 years (8 years + 2 year contingency)
    - » ==> 3 year excavation (+ 2 year contingency)
  - Electricity ~2MW

#### Potential UNO Sites and NUSL

- US NUSL candicate sites
  - Homestake Mine, Lead, S. Dakoda
  - San Jacinto Mountain, Palm Springs, California
    - » Stony Brook: co-author of the proposal
  - WIPP, Carlsbad, New Mexico
    - » declared as an underground research facility by DOE (2000)
- Foreign UNO candidate sites
  - Frejus tunnel
    - » escalating enthusiam in European community
  - Kamioka mine
    - » Hyper-Kamiokande proposal being considered

#### UNO Future Plans and Outlook

- UNO detector (20x SuperK fid. vol., 650kton total volume) can be build today @\$400M ~\$500M
  - tackles some of the most important physics questions today w/ potential of major discoveries
  - detector R&D, optimization and cost estimation being carried out
  - looking to expand the proto-collaboration
  - A formal proposal (LOI) by the end of 2002
  - A window of opportunity for great physics within next 10~15 years
  - If built, it will provide a comprehensive nucleon decay and neutrino physics program for the US and world science community for the 21th century
  - Intersection of interests from HEP, NP and AP communities; local communities (and senetors) at WIPP/Carlsbad and Homestake; and international community (Japan: Hyper-Kamiokande, Europe: CERN/ Frejus (133 km) initiatives, Canada: Sudbury...)
  - Stony Brook goup will play a leading role in both UNO and NUSL efforts

# President Clinton on Super-Kampikands Observation of non-zero Neutrino Mass

First, we must help you to ensure that America continues to lead the revolution in science and technology. Growth is a prerequisite for opportunity, and scientific research is a basic prerequisite for growth. Just yesterday in Japan, physicists announced a discovery that tiny neutrinos have mass. Now, that may not mean much to most Americans, but it may change our most fundamental theories -- from the nature of the smallest subatomic particles to how the universe itself works, and indeed how it expands.

This discovery was made, in Japan, yes, but it had the support of the investment of the U.S. Department of Energy. This discovery calls into question the decision made in Washington a couple of years ago to disband the superconducting supercollider, and it reaffirms the importance of the work now being done at the Fermi National Acceleration Facility in Illinois.

-- President Clinton's address to the MIT graduates (June 6, 1998)

#### **NY Times on Neutrinos**

#### Mass Found in Elusive Particle; Universe May Never Be the Same

Discovery on Neutrino Rattles Basic Theory About All Matter By MALCOLM W. BROWNS.

TAKAYAMA, Japan, June 3 - In what colleagues halled as a haroric landmark, 120 physicists from 23 re-setrch institutions in Japan and the United States assumed today that they had found the estateace of must it a notoriously charge substance particle called the restress

The neeting, a particle that car-ries no electric charge, is so light that it was ensured for many years to have no mans at all. After today's anneurowees, commission will have to confront the pensibility that a
